In some cases, you got the following error when trying to install a Windows VM in VirtualBox with unattended installation. The error during Windows setup appears to be caused by malformed unattended XML configuration file.

To fix the issue, you can follow the steps below:

1. Turn off the virtual machine.
2. Open the Oracle VM Virtual Manager -> Right-click on the VM in the VM list, then select Show in Explorer to open the installation location of the virtual machine.
3. Inside that directory, you will find the unattended XML Source File. The file is named as **Unattended-xxxxx.xml**.

#### Option 1:

- 1) Delete this file.
- 2) Install it again and give the product key while installation.

#### Option 2:

- 1) Open the xml in a notepad
- 2) Scroll down and give Key if known

```
<UserData>
  <ProductKey>
    <Key></Key>
    <WillShowUI>OnError</WillShowUI>
  </ProductKey>
  <AcceptEula>true</AcceptEula>
</UserData>
```

Start the virtual machine again, and the error should be gone. The unattended installation should be started to auto-install the guest without any user interaction.
